-!- FUNCTION: THE GROWTH FACTOR STIMULATES THE GROWTH OF VARIOUS EPIDERMAL AND EPITHELIAL TISSUES IN VIVO AND IN VITRO AND OF SOME FIBROBLASI NI CELL OUTURE.

-!- SUBCELLULAR LOCATION: TYPE I membrane protein.
-!- SIMILARITY: CONTAINS 9 EGF-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CYTOPLASMIC (POTENTIAL).

TISSUE SPECIFICITY: DETECTED IN ALL AREAS WITH NEUROGENIC
ABILITIES, FOR EXAMPLE THE NEUROGENIC ECTODERM AND THE PRIMORDIA
OF THE SENSE ORGANS. LATER EXPRESSION IS RESTRICTED TO THOSE CELLS
THAT HAVE ADOPTED A NEURAL FATE.

DEVELOPMENTAL STAGE: EXPRESSED BOTH MATERNALLY AND ZYGOTICALLY. EXPRESSION IS HIGHEST ERRLY IN EMBRYONIC DEVELOPMENT (STAGE 5) AND REDUCES TO A LOW LEVEL DURING LARVAL STAGES.

MISCELLANEOUS: SEPARATION OF NEUROBLASTS FROM THE ECTODERM INTO THE INNER PARY OF EMBRYO IS ONE OF THE FIRST STEPS OF CNS DEVELOPMENT IN INSECTS, THIS PROCESS IS UNDER CONTROL OF THE
                                                                                                                        NEUROGENIC GENES.
MISCELLANEOUS: NOTCH AND SERRATE MAY INTERACT AT THE PROTEIN
LEVEL, IT IS CONCEIVABLE THAT THE SERRATE AND DELTA PROTEINS MAY
COMPETE FOR BINDING WITH THE NOTCH PROTEIN.
SIMILARITY: CONTAINS 9 EGF-LIKE DOMAINS.
SIMILARITY: CONTAINS 1 DSL DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CYTOPLASMIC (POTENTIAL).

Human epidermal growth factor. High resolution solution structure and comparison with human transforming growth factor alpha.";
J. Mol. Biol. 227:271-272-27297.
I. FUNCTION: THE GROWTH FATOR STIMULATES THE GROWTH OF VARIOUS EPIDERMAL AND EPITHELIAL TISSUES IN VIVO AND IN VITRO AND OF SOME FIRBOBLASTS IN CELL CULTURE.
IL SUBCELLULAR LOCATION: Type I membrane protein.
I. SUBCELLULAR CONTAINS 9 EGF-LIKE DOMAINS.

This peptide is used in the invention to prepare a composition to target laminin receptors. EGF derived peptides inhibit blood vessel formation through their antagonism of the high affinity 67kD laminin receptor found on endothelial cells. The peptide is modified in the preparation of a medicament for binding to laminin receptors as an (ant) agonist. The medicament is also useful for healing endothelial cell wounds and treating anglogenic diseases, especially rethopathy of finantial concert.
                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel.ErbB-4 ligand, neuregulin-4 (NRG-4). NRG-4 binds to mammalian ErbB-4 receptor and can be expressed by standard recomplinant methodology. Pharmaceutical compositions comprising NRG-4 are
                                                                                                                                                                                        Candida spp. infection, and parasitic infestations like leishmania and trichhomonas vaginalis. The peptide are anti-anglogenic in human models. The peptides also inhibit both laminin- and EGF-stimulated angiogenesis, and prevent tumour cell attachment to basement membranes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel ErbB-4 ligand, referred as neuregulin (NRG)-4 and polynucleotide sequences encoding NRG-4, useful. for upregulating or downregulating ErbB-4 receptor activity to treat Alzheimer's disease, stroke, gastric

useful for regulating an endogenous protein affecting ErbB-4 receptor activity in vivo. They are also useful for treating or preventing a disease condition or syndrome associated with disregulation of an endogenous protein affecting ErbB-4 receptor activity, e.g., amyotrophic atcepts protein affecting ErbB-4 receptor activity, e.g., amyotrophic atrophy, brain trauma, stroke, ischemia, Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, Huntington's chorea, Down's concer, cervical carcinoma, endometrial adenocarcinoma, pancreatic prostate, breast and ovarian cancer, cervical carcinoma, endometrial adenocarcinoma, pancreatic D cells-somatostatinoma and Zollinger-Ellison syndrome. The agent comprised in the pharmaceutical composition includes a polypeptide (e.g., a soluble lighand binding domain of ErbB-4 i.e., IgB4; or a monoclonal, polyclonal, humanized, single chain antibody or an immunoreactive derivative of an activity. Traceable synthetic/recombinant NRG-4-tagged molecules can serve as a diagnostic tool in which cells binding NRG-4 can be measured, Sequences AAGG66044-53 represent the EGF-like motifs of various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Cell growth factor; viscoelastic solution; fibroblastic growth factor; FGF; epidermal growth factor; EGF; buffered solution; lubrication; carboxypropyl methylcellulose; cellulose gum; dextran; dextran sulphate; chondroitin sulphate; sodium hyaluronate; osmolarity; mitogenic; wound healing; cell protection; cell coating; surgery; tissue space; hydroxypropyl methylcellulose; manipulation.
                                                                                                                                                                                                                                                                                                                                                    The human rEGF is used to treat oversecretion of gastric acid or epithelial wound. EGF is modified to increase its chemical stability. Its storage life is improved without diminishing its biological activity. The proteins may be prepared by traditional chemical or recombinant means.
                                                                                                                                                                                                                                                                                      Human epidermal growth factor – is substituted at position 11 greater stability and improved storage life.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "Given in the specification as Try"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 50; DB 11;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The inventors claim synthetic peptides which correspond to sequences occurring in EGF, but excluding EGF. The synthetic peptides correspond to active sequences from EGF fragments: 3-14, 12-14, 12-15, 3-10, 29-37 and 33-37 (Claims 2-7 and AAP91659-P91664 resp.). The peptides are analogenic. Their relative shortness means that they pose fewer synthesis problems than the entire EGF molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

This is a chimeric epidermal growth factor (EGF) protein AC. This chimeric EGF protein contains sequences derived from human and mouse EGF sequences. The chimeric EGF proteins can be recombinantly produced by culturing a microorganism of the genus Bacillus transformed by an expression vector containing the encoding DNA molecules. The recombinant chimeric EGF proteins exhibit a wide variety of physiological activities similar to those of naturally occurring EGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                         Chimeric epidermal growth factor proteins - and DNA molecules for their recombinant production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Epidermal growth factor; EGF; chimeric; human; mouse; recombinant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                      The sequences given in AAR67273-76 are cell growth factors which may be used in the viscoelastic solution of the invention. The peptides are defived from fibroblastic growth factor (FGF) and epidermal growth factor (FGF). The viscoelastic solution also comprises a growth factor (FGF). The viscoelastic solution also comprises a buffered solution which is pref. a buffered balanced salt solution, at least 1 of hydroxy- or carboxypropyl methylcellulose, a cellulose gum, dextran or dextran sulphate, chondroith sulphate, and sodium hyaluronate. It has a pH of 6-8 and an osmolarity of 200-400 moSmol/1. The growth factors are mitogenic in vitro for a wide range of tissues and the viscoelastic soln. may be used as a surgical soln. which is in direct contact with cells undergoing wound healing. It also provides a cell protection and cell coating during surgery. The soln. provides maintenance of tissue space, hydroxypropyl methylcellulose and now hall contact with the tissue, while sodium hyaluronate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   from the present anywhertor inverse epiderial structions as method for from the present invention. The present invention describes a method for the isolation of recombinant epidermal growth factor (EGF) from whole broth. The method comprises: (a) passing a culture containing the protein upwards through a column containing a fluidised bed of ion exchanger, washing the ion exchanger to remove non-adsorbed material, allowing the ion exchanger to remove non-adsorbed material, allowing the ion exchanger to settle, and eluting adsorbed protein by passing an eluant downwards through the column; (b) filtering the eluate passing an eluant downwards through the column; (b) filtering the eluate passing an embrane with a molecular weight cutoff of 10000, and (c) concentrating the filtrate on a membrane with a molecular weight cutoff of 5000. The method is for isolating recombinant human, mouses, pig or of 5000. The method is for isolating recombinant human, mouses, pig or cat EGF, or an EGF analogue with one of four defined amino acid sequences (given in the specification), from Bacillus brevis cultures. The EGF proteins can be recovered in high yield and high purity without the need to pretreat the culture broth to remove the cells, e.g. by costly
                                                                                                                                                                                                                                                                                  ö
                                                                                  This is a chimeric epidermal growth factor (EGF) protein ABC. This chimeric EGF protein contains sequences derived from human and mouse EGF sequences. The chimeric EGF proteins can be recombinantly produced by culturing a microorganism of the genus Bacillus transformed by expression vector containing the encoding DNA molecules. The recombinant chimeric EGF proteins exhibit a wide variety of physiological activities similar to those of naturally occurring EGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           present sequence represents mouse epidermal growth factor (EGF)

The present sequence represents a protein which has epidermal growth factor (EGF) like activity, from the present invention. The present invention describes a method for the isolation of recombinant epidermal growth factor (EGF) from whole broth. The method comprises: (a) passing a culture containing the protein upwards through a column containing a culture containing the protein upwards through a column containing a disorbed metraial, allowing the ion exchanger to remove non-adsorbed meterial, allowing the ion exchanger to settle, and eluting adsorbed protein by passing an eluant downwards through the column; (b) adsorbed protein by passing an eluant downwards through the column; (b) filtering the eluate through a membrane with a molecular weight cutoff of $5000. The method is for isolating recombinant molecular weight cutoff of $5000. The method is for isolating recombinant human, mouse, pig or rat EGF, or an EGF analogue with one of four human, mouse, pig or rat EGF, or an EGF analogue with one of four human, mouse, pig or rat EGF, or an EGF analogue with one of four human, mouse, pig or rat EGF, or an EGF analogue with one of four human, muster, the EGF proteins can be recovered in high yield and brevis cultures. The EGF proteins can be recovered in high yield and high purity without the need to pretreat the culture broth to remove the calls, e.g. by costly centrifugation or membrane filtration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a protein which has epidermal growth factor (BGF) like activity, from the present invention. The present invention describes a method for the isolation of recombinant epidermal growth factor (BGF) from whole broth. The method comprises: (a) passing fluidised bed of ion exchanger, washing the ion exchanger to remove non-scanned material, allowing the ion exchanger to settle, and eluting a disorbed material, allowing the ion exchanger to remove non-gasorbed protein by passing an eluant downwards through the column; (b) filtering the eluter through a membrane with a molecular weight cutoff of 5000. The method is for isolating recombinant column, mouse, pig or rat EGF, or an EGF analogue with one of four human, mouses, pig or rat EGF, or an EGF analogue with one of four cheris cultures. The EGF proteins can be recovered in high yield and thish purity without the need to pretreat the culture broth to remove the colls, e.g. by costly centrifugation or membrane filtration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of plasmodium MSP-1.4.2, and has the same affinity for at least MSP-1.4.2, compared to natural MSP-1.1.9. The non-natural variants of and can be used to natural MSP-1.1.9. The non-natural variants of and can be used to treat malaria. The present sequence is human epidermal growth factor (EGF). This sequence was used in a sequence homology comparison with the wild-type MSP-1 protein from P. falciparum (see AAB37608), which was used to generate the variants of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Humanised form; monoclonal antibody alpha 340; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          õ
                                                                                                                                                                                                                                                       The present invention relates to a humanised form of the antibody 340 (a mouse monoclonal antibody which binds to epidermal growth factor (EGF) receptor and inhibits binding of EGF), obtainable from the cell line deposited with the ECACC under accession number 97021428. The humanised form of the antibody 340 Ha useful in gene therapy, medicine and in the manufacture of a medicament for treatment or prophylaxis of cancer. The invention is useful for treating colorectal, lung, breast, gastric or ovarian cancers or also for preventing the recurrence of cancer after initial treatment or surgery. The invention is also useful for enhancing a protective immune response against cancer by optimised immune responses against cancer by optimised immunisation schedules. The humanised form of the antibody 340 has reduced immunisation celeptor, as the original murine antibody and has increased ability to inhibit the growth of EGF receptor expressing cells. The invention is used as cell growth and apoptosis inhibitor. The present sequence

The invention describes a method of forming (MI) chimeric polynucleotides (I). The method comprises contacting a population of angle stranded scaffold fragments (SF) with population of donor fragments (DF) to form a complex (II) comprising at least one SF hybridised to two DFs. (II) streated so that single stranded regions of (II) are filled in and adjacent fragments are ligated. (MI) is useful for a directed evolution process which involves forming a library of (I) that can be screened for a characteristic of interest. Subsequent rounds of directed evolution can produce chimeric polynucleotides with an improved characteristic of interest. The methods facilitate the canceration of chimeric polynucleotides and do not require hybridising donor fragments to a target or full-length template. Because the chimeragenesis process does not rely upon a contiguous, full-length template, it is unnecessary to modify a template to facilitate its removal. This is the amino acid sequence of the mouse epidermal growth factor (EGF) used to demonstrate a method of in vitro recombination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Forming chimeric polynucleotide by contacting single-stranded (ss) scaffold fragment, and donor fragment populations to form hybridised complex having ss regions which are filled-in, and ligating adjacent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mouse; epidermal growth factor; receptor; EGF; chimeric polynucleotide; directed evolution; chimeragenesis; recombination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ; Score 50; DB 23; Length 54; Pred. The invention describes a method of forming (MI) chimeric
conjuncteotides (I). The method comprises contacting a population of
conjuncteotides (I). The method comprises contacting a population of
conjuncted evolution form a complex (II) comprising at least one SF
conjunction and adjacent fragments are ligated. (MI) is useful for the filled in and adjacent fragments are ligated. (MI) is useful for a directed evolution process which involves forming a library of (I)
conjuncted evolution can produce chimeric polynucleotides with an office confunction of chimeric polynucleotides and do not require hybridising confunction of chimeric polynucleotides and do not require hybridising confunction of chimeric polynucleotides and do not require hybridising confunction of chimeric polynucleotides and do not require hybridising confunction of chimeric polynucleotides and do not require hybridising confunction of chimeric polynucleotides and do not require hybridising confunction of chimeric polynucleotides and do not require hybridising confunction of chimeric polynucleotides and contiguous, full-length confunction confined it is unnecessary to modify a template to facilitate its conformation described in the method of in vitro protein (AAU76705) and used to demonstrate a method of in vitro
                                                                                                                                                                                                                                                                                                                                                Forming chimeric polynucleotide by contacting single-stranded (ss) scaffold fragment, and donor fragment populations to form hybridised complex having ss regions which are filled-in, and ligating adjacent
                                                                                                                                                                                              (ENCH-) ENCHIRA BIOTECHNOLOGY CORP.

Patent No. 5750652
GENERAL INFORMATION:
APPLICANT: Artavanis-Tsakonas, Spyridon
APPLICANT: Busseau, Isabelle
APPLICANT: Diederich, Robert J.
APPLICANT: Matsuno, Kenji
TITLE OF INVENTION: DELTEX PROTEINS, NUCLEIC ACIDS, AND
TITLE OF INVENTION: ANTIBODIES, AND RELATED METHODS AND COMPOSITIONS
NUMBER OF SEQUENCES: 23
CORRESPONDENCE ADDRESS:

R; Hori, S.; Saitoh, T.; Matsumoto, M.; Makabe, K.W.; Nishida, H.
Dev. Genes Evol. 207, 371-380, 1997
A; Title: Notch homologue from Halocynthia roretzi is preferentially expressed in the A; Reference number: 220775
A, Accession: 130201
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A; Experimental source: PC-12 cell
C; Comment: This protein is a member of the epidermal growth factor family. It is
sting the differentiation of MDA-MB-453 cells.
C; Superfamily: human ErbB kinase activator alpha, brain and thymus; EGF homology
F;1-25/Domain: EGF homology (fragment) < EGF>

"EGF homologous sequences encoded in the genome of Drosophila melanogaster, and their relation to neurogenic genes.";
EMBO J. 6:761-766(1987).

-I - FUNCTION: MAY PLAY A ROLE IN THE DEVELOPMENT OF EPITHELIA, POSSIBLY FOR THE ESTABLISHMENT AND/OR MAINTENANCE OF CELL POLARITY. IT MAY ACT AS A SIGNAL.

-I - SUBCELLULAR LOCATION: Type I membrane protein.

-I - SUBCELPRIATED 10 THE CYTOPLEASHIC DOMAIN (POTENTIAL).

-I - SIMILARITY: CONTAINS 3 LAMININ G-LIKE DOMAINS.
